Drinking Water Quality Report 2001

Public Utilities

*The **City of Casper** is pleased to provide you with our **Drinking Water Quality Report** for 2001. This report is a summary of the quality of water provided in 2001 and is required by the Environmental Protection Agency as part of the Safe Drinking Water Act. We gladly support this regulation, as we believe in your right to know.*

*The purpose of this report is to inform our customers about the **high-quality water** and services we deliver. Daily, the City of Casper supplies an average of 10 million gallons of drinking water to its customers. The water is purchased wholesale from the Central Wyoming Regional Water System who aggressively safeguards the water supply. Providing you with a safe and dependable supply of drinking water will remain our constant goal.*

*The **City of Casper** is proud to report that **our drinking water is safe** and meets all the stringent drinking water quality standards set forth by the Environmental Protection Agency.*

Casper Water – the BEST drink in town!

Casper Water: A great value

Your water rates pay for delivering high-quality water to your door and keeping the water system in top condition. The money we receive from customers is invested in ensuring reliable, high-quality water and service.

The average residential customer pays two-tenths of a cent for a gallon of tap water. Casper's water rates compare favorably to rates in other municipalities, and tap water is a bargain when compared to bottled water. A dollar buys 500 gallons of tap water.

Water makes up almost two-thirds of the human body and helps nearly every part of the body function. The following are just some of the things water does in the body:

- Regulates body temperature
- Protects and cushions vital organs
- Cushions joints
- Removes waste
- Helps the body absorb nutrients
- Helps convert food into energy
- Carries nutrients and oxygen to all cells in the body

Drinking Water Quality Report 2001

In our water

The 10 substances listed in the table below were detected in Casper's water during 2001. All are below levels allowed by Federal regulations.

Not listed are 66 other regulated contaminants for which we tested that were not detected. These include radioactive contaminants; inorganic contaminants; pesticides, herbicides and other synthetic organic contaminants; and volatile organic contaminants. Additional information on the analysis can be obtained by calling Casper Public Utilities at 235-8213.

Your water is monitored 365 days a year. Tests are done before and after treatment and while your water is in the distribution system. The results are compared to the stringent contaminant level limits and goals set by the Environmental Protection Agency to ensure that your drinking water is safe.

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily mean water may be a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at (800) 426-4791.

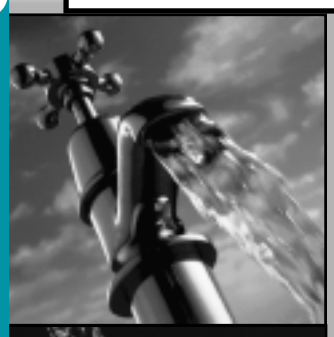
Lead & copper in drinking water

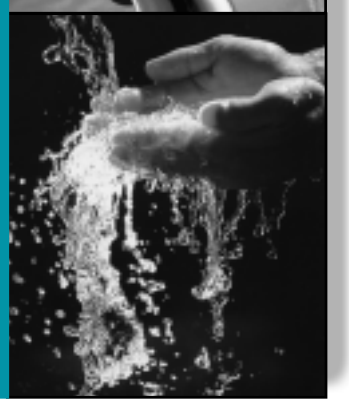
The water you receive contains naturally occurring low levels of lead and copper. Lead and copper can also leach into your water from plumbing systems. Considered at risk are homes built before 1986 that may have copper pipes with lead solder or before 1950 that may have lead service lines. Also, brass fixtures, regardless of age, generally contain some lead.

Infants and children who drink water containing lead in excess of the action level (see table below) could experience delays in their physical or mental development. Children could show slight deficits in attention span and learning disabilities. Adults who drink this water over many years could develop kidney problems or high blood pressure.

Lead levels can easily be reduced by running the water 30 seconds to two minutes before using it. This is especially important if the water has not been used for six or more hours.

SUBSTANCE	VIOLATION	HIGHEST LEVEL ALLOWED (MCL)	HIGHEST LEVEL DETECTED	RANGE OF LEVEL DETECTED OR # EXCEED AL	IDEAL GOALS (MCLG)	POTENTIAL SOURCES OF CONTAMINANT
Regulated at the Groundwater Sources and Treatment Plant						
Arsenic	No	50 ppb	2 ppb	ND – 2 ppb	none set	Erosion of natural deposits
Fluoride	No	4 ppm	0.41 ppm	0.34 – 0.41 ppm	4 ppm	Erosion of natural deposits
Nitrate (as Nitrogen)	No	10 ppm	0.24 ppm	ND – 0.24 ppm	10 ppm	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Selenium	No	50 ppb	34 ppb	ND – 34 ppb	50 ppb	Erosion of natural deposits
Sodium	No	not regulated	37.7 ppm	25.7 – 37.7 ppm	none set	Erosion of natural deposits
Turbidity	No	TT	0.413 NTU	0.048 – 0.46 NTU	NA	Soil runoff
Regulated at the Consumer's Tap						
Lead	No	15 ppb AL	4 ppb	no site exceeded AL	0	Household plumbing
Copper	No	1.3 ppm AL	0.88 ppm	no site exceeded AL	1.3 ppm	Household plumbing
Regulated in the Distribution System						
Total Coliform Bacteria	No	< 5 % positive	2.7%	ND – 2.7%	0	Naturally occurring
Total Trihalomethane	No	100 ppb	2 ppb	ND – 2 ppb	0	Drinking water chlorination by-product





Definitions

AL Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. Action Levels are reported at the 90th percentile for homes at greatest risk.

MCL Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available technology.

MCLG Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

NA Not applicable: The EPA has not requested monitoring for this contaminant.

ND Non-detects: The contaminant was monitored but not detected.

NTU Nephelometric Turbidity Unit: The measurement of the clarity of water.

pCi/L pico Curies per liter: A measure of the radioactivity in water.

ppm One part per million. The measurement corresponds to 1 minute in 2 years or 1 penny in $10,000.

ppb One part per billion. The measurement corresponds to 1 minute in 2,000 years of 1 penny in $10,000,000.

TT Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.

Drinking Water Quality Report 2001

Drinking water: a precious resource

Less than 1 percent of all the water on earth is fresh water that can be used by people and other terrestrial organisms. Ninety-seven percent of the earth's water is in the oceans and 2 percent is frozen in polar ice caps.

Casper Water facts (2001)

- average annual use per household was 145,000 gallons
- average annual cost per household was $319
- average daily use by all customers was 10,000,000 gallons
- maximum hour demand was June 29, from 8 p.m. until 9 p.m.

Sources of Casper's drinking water

The City of Casper purchases wholesale water from the Central Wyoming Regional Water System for your use. The water comes from two sources: groundwater and surface water. In order to meet the demand for water from May through September, groundwater is blended with surface water.

Groundwater provides an average of seventy-one percent of Casper's water. Groundwater is pumped from the North Platte River alluvial aquifer via 30 wells and is treated with ozone and chloramines for disinfection and a corrosion inhibitor to reduce corrosion of water mains and residential plumbing systems.

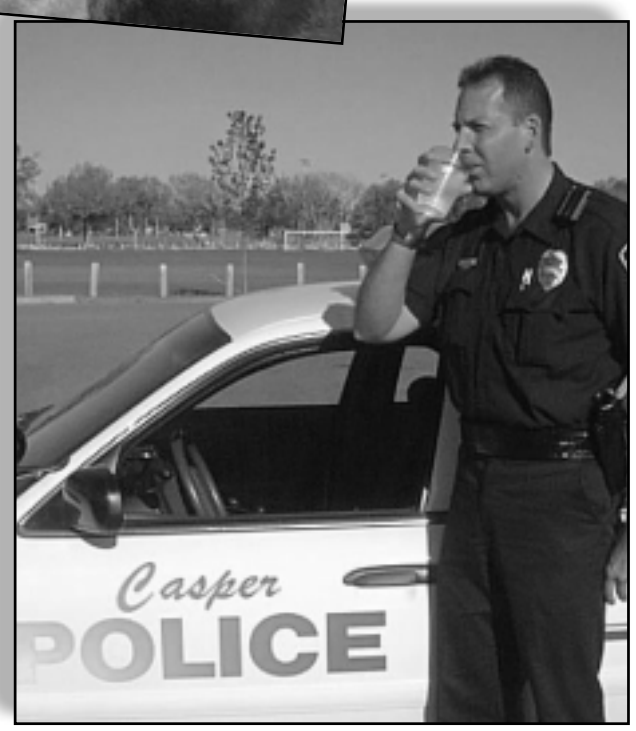
An average of twenty-nine percent of Casper's water is surface water drawn from the North Platte River. This water originates as snowmelt from the upper North Platte River basin and is clarified, disinfected with ozone, filtered, disinfected with chloramines, and treated with a corrosion inhibitor before it is released into the distribution system.

Sources of drinking water

All drinking water (both tap and bottled) comes from sources that include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it can dissolve naturally occurring minerals and, in some cases, radioactive materials. It can also pick up substances resulting from the presence of animal or human activity.

Contaminants that may be present in source water before it is treated include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural operations and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally occurring or result from urban storm water runoff, industrial or domestic waste water discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that can come from agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants that can come from industrial processes, gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants that can be naturally occurring or the result of oil and gas production and mining activities.



Drinking Water Quality Report 2001

Special considerations

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Guidelines from the Environmental Protection Agency and the Centers for Disease Control on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

Frequently Asked Questions

? What is water hardness?

Hardness refers to dissolved minerals in the water (calcium and magnesium) that interfere with the sudsing action of soap. The harder the water, the less the sudsing action. The water you receive is hard with hardness levels that range from 200 ppm to 300 ppm (or 11.7–17.5 grains per gallon). A hardness less than 50 ppm (or 2.9 grains per gallon) is considered soft.

? My water is cloudy sometimes but clears up. May I drink it?

The "cloudiness" is air trapped in tiny bubbles in the water. These harmless bubbles enter the water when air is drawn into the water transmission system. This is usually temporary, and the water clears in a short time.

Cryptosporidium & Giardia

Cryptosporidium and giardia are microscopic organisms that, when ingested, can result in diarrhea, fever, and other gastrointestinal symptoms. In recent years, these have been found in surface water across the country. Cryptosporidium can also be transmitted through contaminated food or direct contact with human or animal waste.

During the year, the Regional Water System had a water sample tested for cryptosporidium and giardia. The sample was analyzed using a method approved by the Environmental Protection Agency, and neither organism was detected. This does not mean that any organisms were not present in the sample only that none were present in the portion examined.

How can I get involved in water quality decisions?

We want our customers to be informed about their water utility. If you want to learn more, please attend any of the regularly scheduled meetings of the:

Casper Public Utilities Advisory Board
on the fourth Wednesday of every month at 7:00 a.m. in the Downstairs Meeting Room at Casper City Hall, 200 N. David St.
or
the **Central Wyoming Regional Water System**
on the third Wednesday of every month at 7:00 p.m. in the Conference Room at the Regional Water Treatment Plant, 1500 S.W. Wyoming Blvd.

Need more information?

Your questions, concerns, and observations are important to us. Contact Casper Public Utilities at 235-8213 or on the web at www.cityofcasperwy.com

For more information about potential health effects of water contaminants contact the U. S. Environmental Protection Agency at 800-227-8917; at the Safe Drinking Water Hotline (800-426-4791); or on the web at www.epa.gov/safewater
